

Inspection Management System

InspectWeb™ is a unique web based management system that simplifies the processes of tracking maintenance requirements, inspections and repair work orders in tribal housing and industrial applications. InspectWeb™ enables the office management staff to maintain tight control over the processes of maintenance requests, inspections, RFPs and work orders for maintenance activities. The system maintains the full work flow process of inspection management.

Features:

- **Request Logging**– Office staff log requests for maintenance from participants and track their needs and priorities.
- **Inspection Assignment and Tracking**– Track the assignment and process of each inspector and rehabilitation request. Open inspections for each inspector are tracked. Inspectors can login to the system via the Internet and perform their write-up task. There is no need to return the office anymore, saving gas and time.
- **Contractor RFP and Assignment**– Produce instant RFPs from the inspector write-ups. Fax or print the RFPs and send to all qualified contractors. Assign jobs to the Contractor and track progress and communications with the participant.
- **Statistical Reporting for IHP**– Reports show totals for job types, recipient demographics and regions. Transfer information right into your Indian Housing Plan.
